ALL THE TABLES ARE IN BCNF; THEREFORE, THE DATABASE IS IN BCNF

STORED PROCEDUERES

1: Login:

```
CREATE OR REPLACE FUNCTION Login ( Username IN Text, Password IN Text )
RETURN NUMBER
AS
FOUND INTEGER;
BEGIN
SELECT count(*) INTO FOUND
FROM User
Where User.username = Username && User.password == password;
IF (FOUND > 0)
        THEN
        UPDATE TABLE User SET IsOnline = 1 WHERE
        User.username=Username&&User.password=password;
        RETURN 1;
ELSE
        SELECT count(*) INTO FOUND
        FROM User
        Where User.username = Username;
        IF (FOUND > 0)
        THEN RETURN 2;
        ELSE RETURN 0;
        END IF;
END IF;
END;
```

2: Log Out:

```
CREATE OR REPLACE FUNCTION Logout ( UserId IN INTEGER)
```

```
RETURN NUMBER
AS
BEGIN
UPDATE TABLE User SET IsOnline = 0 WHERE User.Id = UserId;
RETURN 1;
END;
```

3: GetId:

```
CREATE OR REPLACE FUNCTION getId (Username IN text, Password IN text)
RETURN INTEGER
AS
Id INTEGER;
BEGIN
SELECT User.Id INTO Id FROM User
WHERE User.username=Username&&User.password=Password;
RETURN Id;
END;
```

4: GetChannels:

```
CREATE OR REPLACE FUNCTION getChannels (UserId IN INTEGER)
RETURN VARCHAR2
AS
ChannelList VARCHAR2(20);
BEGIN
SELECT Channels.Id, Channels.Owner_id INTO ChannelList FROM Channels
```

```
WHERE Channel.Owner_id=UserId;
RETURN ChannelList;
END;
```

5: GetChannelId:

```
CREATE OR REPLACE FUNCTION getChannelId (UserId IN INTEGER, ChannelName IN VARCHAR)
RETURN INTEGER
AS
ChannelID INTEGER;
BEGIN
SELECT Channels.Id  INTO ChannelID FROM Channels
WHERE Channel.Owner_id=UserId && Channel.name=ChannelName;
RETURN ChannelID;
END;
```

6: GetVideos:

```
CREATE OR REPLACE FUNCTION getVideos (ChannelId IN INTEGER)
RETURN VARCHAR2
AS
VideoList VARCHAR2(20);
BEGIN
SELECT Video.Id, Video.name INTO VideoList FROM Video
WHERE Vider.Channel_id=ChannelId;
RETURN VideoList;
END;
```

7:GetLikes:

```
CREATE OR REPLACE FUNCTION getLikes (VideoId IN INTEGER)
RETURN NUMBER
AS
LIKES NUMBER;
```

```
BEGIN
SELECT COUNT(*) INTO LIKES FROM VideoLD WHERE VideoLD.Video_id=VideoId && LD = 1;
RETURN LIKES;
END;
```

7:GetDisLikes:

```
CREATE OR REPLACE FUNCTION getDisLikes (VideoId IN INTEGER)
RETURN NUMBER
AS
DISLIKES NUMBER;
BEGIN
SELECT COUNT(*) INTO DISLIKES FROM VideoLD WHERE VideoLD.Video_id=VideoId && LD = 0;
RETURN DISLIKES;
END;
```

8:Search:

```
//using cursor
CREATE OR REPLACE FUNCTION Search (SearchText IN VARCHAR2)

UI IMPLEMENTATION

CONNECTING FRONT END (UNITY) WITH SQLITE DATABASE

```
using UnityEngine; using Mono.Data.Sqlite; //Unity library for handling
database functions. using System.Data; using UnityEngine.UI;

public class testdb : MonoBehaviour
{
    /*
        ->Given below is an EventListener;
        ->An EventListener can register itself to any number of events (of the same type);        -
>//in this implementation, it is directly called using the built in Unity UI;( dont need to know
this);
        ->When an event(like login button pressed,etc) is triggered,
all the Listeners registered to that event will be invoked;         -
>And all the required operations(like retrieving data from the
database,Inseting,Deleting,etc) can be done            the event
listener;
        ->Below is am implementation which shows exactly how this done.
    */
    void AnyEventListner()
    {
        /*In our implementation the database is stored locally inside the application. But this
also works
         if the database is stored on a remote server . In the later case a TCP connection will
be established
        with the server and the database can be accessed as if it was stored locally*/

        string conn = "URI=file:" + Application.dataPath + "databasename.db";
        /*Path to database.
        (Application.dataPath gives the path of the resource folder within windows where the
database is stored)*/

        IDbConnection dbconn;
        dbconn = (IDbConnection)new SqliteConnection(conn);
        /*Establish  a connection with the database*/

        dbconn.Open();
        /*Open connection to the database.*/

        IDbCommand dbcmd = dbconn.CreateCommand();
        /*creates a new databaseCommand object.See documentation for more details.(link provided
below)*/
```

```
        string sqlQuery = "SELECT _id,_userName,_password " + "FROM User";
        /*This Query can be any valid sql statement( Select,insert,delete,update.SQLITE DOES NOT SUPPORT SP)*/

        dbcmd.CommandText = sqlQuery;
        /*set the CommantText field to the above query(see doc for more details)*/
        IDataReader reader = dbcmd.ExecuteReader();
        /*Execute the above set query.
         This functions returns a value of the type IDataReader(see doc for more
details).          here is an example of how this works:          consider the query used
above(select id,username,password from user):          id is of type int
         username and password are of type string
         IF the query returns 10 rows, the reader will also have 10 rows
with          id,username and password in each row in the same squence.
*/

        while (reader.Read())//(Reads one row(tupple) from the reader and returns true if read successfull(i.e
data available;
        {    //The next time the Read method is called, it reads the next row until no rows are avalable(see
documentation).

            /*Now to read data from the reader object, you use the Get( with appropriate type cast ) method.
* In this case , each tuple contains id,username and passwword(in this order), So to get this you call
* the appropriate Get method with the proper index of the data.
* i.e id will have index 0 and the type is int ,so we use reader.GetInt32(0);
* username will have index 1 and the type is String(or Text),so we use reader.GetString(1);
* and so on;
             */

            int id=reader.GetInt32(0);
string username=reader.GetString(1);
string password=reader.GetString(2);

            /*After retriving the data we can do the required operations like make changes to the UI,database
etc*/
            //EXAMPLE(code doesnt make any sense.just for demonstration)
            Text datatext = gameObject.GetComponent<Text>();
if (password.Length > 8)
            {
                datatext.text = id +"  "+ username +"  "+ password;
            }
else
{
                datatext.text = "invalid password";
datatext.color = Color.red;
            }
        }

        //After running all operations ,you can close the connection to the database;
reader.Close();

        dbcmd.Dispose();

        dbconn.Close();

    }
}
```

DOCUMENTATION: https://www.mono-project.com/docs/database-access/providers/sql/

CONNECTING FRONT END(UNITY) WITH MY-SQL SERVER (supports SP)

```
using System;
using System.Data;
using System.Data.SqlClient;

public class Test
{

    public void AnyEVENTListner()
    {

        string connectionString =
            "Server=TestServer;" +
            "Database=test;" +
            "User ID=sa;" +
            "Password=MightyMighty;";

        IDbConnection dbcon;

        using (dbcon = new SqlConnection(connectionString)) {
            dbcon.Open();
            using (IDbCommand dbcmd = dbcon.CreateCommand()) {
                string sql =
                    "SELECT fname, lname " +
                    "FROM employee";
                dbcmd.CommandText = sql;
                using (IDataReader reader = dbcmd.ExecuteReader()) {
                    while(reader.Read()) {
                        string FirstName = (string) reader["fname"];
                        string LastName = (string) reader["lname"];
                        Console.WriteLine("Name: " +
                             FirstName + " " + LastName);
                    }
                }
            }
        }
    }
}
